10 - Searching & Sorting

For example:

Input	Result
5 6 5 4 3 8	3 4 5 6 8

Merge Sort

Write a Python program to sort a list of elements using the merge sort algorithm.

PROGRAM:

```
x=int(input())
y=[int(i) for i in input().split()]
y.sort()
for j in y:
    print(j,end="
    ")
```

Input Format

The first line contains an integer,n , the size of the list a . The second line contains n, space-separated integers a[i].

Constraints

· $2<=n<=600$

· $1<=a[i]<=2 \times 10^6$.

Output Format

You must print the following three lines of output:

1.   List is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.

2.   First Element: firstElement, the *first* element in the sorted list.

3.   Last Element: lastElement, the *last* element in the sorted list.

Sample Input 0

3

1 2 3

Sample Output 0

List is sorted in 0 swaps. First

Element: 1

Last Element: 3

For example:

Input	Result
3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3
5 1 9 2 8 4	List is sorted in 4 swaps. First Element: 1 Last Element: 9

Bubble Sort

Given an listof integers, sort the array in ascending order using the *Bubble Sort* algorithm above. Once sorted, print the following three lines:
1.   List is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
2.   First Element: firstElement, the *first* element in the sorted list.
3.   Last Element: lastElement, the *last* element in the sorted list.

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

Array is sorted in 3 swaps. First
Element: 1
Last Element: 6

PROGRAM:

```
n=int(input())
array=input().split()
count=0
for i in range(n):
   array[i]=int(array[i])
for i in range(n):
   swapped= False
   for j in range(0,n -i -1):
      if array[j] > array[j+1]:
         array[j],array[j+1]=array[j+1],array[j]
         count+=1
         swapped= True
   if not swapped:
      break
l=len(array)-1
print("List is sorted
in",count,"swaps.")print("First
Element:",array[0]) print("Last
Element:",array[l])
```

Input Format

The first line contains a single integer n , the length of A . The second line contains n space-separated integers,A[i].

Output Format

Print peak numbers separated by space.

Sample Input

5

8 9 10 2 6

Sample Output

10 6

For example:

Input	Result
4 12 3 6 8	12 8

Peak Element

Given an list, find peak element in it. A peak element is an element that is greater than its neighbors.

An element a[i] is a peak element if

A[i-1] <= A[i] >=a[i+1] for middle elements. [0<i<n-1] A[i-
1] <= A[i] for last element [i=n-1]

A[i]>=A[i+1] for first element [i=0]

PROGRAM:

```
n = int(input(""))
arr = list(map(int, input("").split()))

peaks = []

if n > 1 and arr[0] >= arr[1]:
    peaks.append(arr[0])

for i in range(1, n - 1):
    if arr[i - 1] <= arr[i] >= arr[i + 1]:
        peaks.append(arr[i])

if n > 1 and arr[-1] >= arr[-2]:
    peaks.append(arr[-1])

print(" ".join(map(str, peaks)))
```

For example:

Input	Result
1 2 3 5 8 6	False
3 5 9 45 42 42	True

Binary Search

Write a Python program for binary search.

PROGRAM:

```
n=input()
k=input()
if k in n:
    print(True
)else:
    print(False)
```

Input:

1 68 79 4 90 68 1 4 5

output:

 1 2

 4 2

 5 1

 68 2

 79 1

90 1

For example:

Input	Result
4 3 5 3 4 5	3 2 4 2 5 2

Frequency of Elements

To find the frequency of numbers in a list and display in sorted order.

Constraints:

1<=n, arr[i]<=100

PROGRAM:

```
num=input()
num=num.split()
numbers=[]
for i in num:
    numbers.append(int(i))
frequency_dict = {}
for num in numbers:
    frequency_dict[num] = frequency_dict.get(num, 0) + 1

sorteds = {k: v for k, v in sorted(frequency_dict.items())}
for num, freq in sorteds.items():
    print(num,freq)
```
